

First Eye on the Sky

First Eye on the Sky	
Introduction	Buying your first telescope
Types of Telescope	How do they differ?
Telescope Mounts	Alt-Az? Equatorial?
Pros and Cons	Why is one better than another?
Prices	A rough guide
Hints and Tips	A few things to consider before handing over your cash

Beginners' Guides

There's lots of help out there.

There are some well-written beginners' guides available on the web ...

... but remember that if they are sponsored by a telescope manufacturer, then they are the only make of telescopes that you will find inside.

Beginners' Guides

All about refractors

What light is refracted, the word "refract" means "to bend". A refracting telescope (usually called a "refractor") uses lenses to bend light so that it comes to a focus. The light then enters the eyepiece and is focused on your eye. The light then enters the eyepiece and is focused on your eye. The light then enters the eyepiece and is focused on your eye.

3 THINGS YOU SHOULD KNOW

- Refractors use a lens system to collect light.
- Refractors are usually easier to use than reflectors.
- Refractors are usually more expensive than reflectors.

All about reflectors

Reflectors use a system of mirrors to collect light. The light enters the telescope and is reflected by a primary mirror at the back of the tube. The light then enters the eyepiece and is focused on your eye. The light then enters the eyepiece and is focused on your eye. The light then enters the eyepiece and is focused on your eye.

3 THINGS YOU SHOULD KNOW

- Reflectors use a system of mirrors to collect light.
- Reflectors are usually easier to use than refractors.
- Reflectors are usually more expensive than refractors.

First Eye on the Sky

Confused? That's Not Surprising

The collage consists of six pages from a guide, each featuring images of different telescope models and technical diagrams. The pages are arranged in a 2x3 grid. The top row shows Newtonian reflectors, and the bottom row shows dual-speed designs. Each page includes text and small images of telescope parts.

Telescope Types

The diagram shows three overlapping circles. The left circle is labeled 'Dioptrics (lenses)' and contains an image of a refractor telescope. The right circle is labeled 'Catoptrics (mirrors)' and contains an image of a reflector telescope. The intersection of the two circles is labeled 'Catadioptrics (elements of both)' and contains an image of a catadioptric telescope. The University of Liverpool logo is at the bottom left.

6

Telescope Types

The diagram shows three overlapping circles. The left circle is labeled 'Refractors' and contains an image of a refractor telescope. The right circle is labeled 'Reflectors' and contains an image of a reflector telescope. The intersection of the two circles is labeled '"Cats"' and contains an image of a catadioptric telescope. The University of Liverpool logo is at the bottom left.

7

Refractor

The diagram shows a refractor telescope with a large objective lens at the front and a smaller eyepiece at the back. Light rays from a distant object enter the objective lens, converge at a focal point, and then diverge towards the eyepiece. The objective lens is labeled 'objective lens' and the eyepiece is labeled 'eyepiece'. The text 'comprising multiple lens elements' is written below the objective lens. The University of Liverpool logo is at the bottom left.

Telescope Mounts – Alt-Az

The simplest mounts allow movement in **altitude** (up-down) and **azimuth** (left-right).

Some alt-az mounts are motorised and can be controlled by your smart phone.

The more it can do, the more you pay.

Telescope Mounts – Equatorial

North Celestial Pole

Why use a mount with axes at such jaunty angles?

Aligning the mount parallel with the Earth's axis means that driving only **one** axis is enough to follow the stars.

Astrophotography

Small "eyepiece cameras" can be used on any telescope.

Telescopes with long focal lengths can provide good images of the **Moon** and the brighter **planets**.

For fainter **deep sky objects**, like nebulae and galaxies, long exposures require that the telescope is on a motor-driven **equatorial** mount.

Serious astrophotographers either buy dedicated astro cameras (left) or use their digital SLR cameras (right).

(The pros and cons of different cameras will be deferred to a future workshop)

Astrophotography

Aside: Remember that astrophotography doesn't **need** a telescope, as you can use a camera on a star tracker:

Astrophotography using a telescope can be very rewarding, but to get the most out of it will take quite a bit of time, effort and cash.

First Eye on the Sky

Pros and Cons

Maksutov

Newtonian

Refractor

Schmidt-Cassegrain

Dobsonian

Lenses suffer from chromatic aberration (colour fringing)

UNIVERSITY OF LIVERPOOL

17

Pros and Cons

Maksutov

Newtonian

Refractor

Schmidt-Cassegrain

Dobsonian

Mirrors get around that problem

UNIVERSITY OF LIVERPOOL

18

Pros and Cons

Maksutov

Newtonian

Refractor

Schmidt-Cassegrain

Dobsonian

Dob = Newtonian on simple alt-az mount

UNIVERSITY OF LIVERPOOL

19

Pros and Cons

Maksutov

Newtonian

Refractor

Schmidt-Cassegrain

Dobsonian

Long focal lengths in compact tubes

UNIVERSITY OF LIVERPOOL

20

First Eye on the Sky

Pros and Cons

Large apertures good for deep sky objects

Maksutov

Newtonian

Refractor

Schmidt-Cassegrain

Dobsonian

UNIVERSITY OF LIVERPOOL

21

Pros and Cons

Largest aperture for a given price

Maksutov

Newtonian

Refractor

Schmidt-Cassegrain

Dobsonian

UNIVERSITY OF LIVERPOOL

22

Pros and Cons

Sealed optics mean low maintenance

Maksutov

Newtonian

Refractor

Schmidt-Cassegrain

Dobsonian

UNIVERSITY OF LIVERPOOL

23

Pros and Cons

Portable or easily transportable

Maksutov

Hints and Tips

Aperture vs Focal Length

Of the two, aperture is more important. Aperture determines how much light is 'caught' by the telescope and the detail in the image. Focal length determines the magnification of a given eyepiece.

Magnification

Your telescope will come with one or two eyepieces that provide you with appropriate magnification. Later, you can think about whether you want more/different eyepieces.

High magnification is less important than you think.

UNIVERSITY OF LIVERPOOL

27

Hints and Tips

Ergonomics

Think about where you will be using the telescope. Will you be carrying it in/out of the house? Does it sit on a tripod or on a table? Will you be taking it to a dark sky site? Does it have to be portable or transportable?

Astrophotography

Visual astronomy and astrophotography have different requirements. The precision with which the telescope tracks the motion of the stars is not critical for you to enjoy the view of Saturn, but it is if you want to take long-exposure images.

First Eye on the Sky

Hints and Tips

GoTo Telescopes

Do you want to get to know your way around the night sky? Manually operated telescopes encourage you to learn the sky. GoTo telescopes can make you a "back-seat driver".

Try Before You Buy

The best way to get a feel for the different types of telescope is to try out a few on an observing evening. View the same object through a variety of telescopes and see what you think.

Buying Secondhand

It's a good idea to take advice from other society members on what you think might be an 'internet bargain'.

29

Hints and Tips

Try to avoid the urge to keep adding accessories...

Jonathan Egoff @Photohorizons

...until you run out of cables.

30

Hints and Tips

Images of telescopes can be misleading if displayed side by side...

31

Hints and Tips

... unless they are shown to scale.

For you, what is a comfortable viewing height?

32

First Eye on the Sky

Hints and Tips

Larger apertures are (generally) better
but remember that large means **heavy**.

2 kg 24 kg

UNIVERSITY OF LIVERPOOL

33

Hints and Tips

Read the spec.

Make sure you know what you are getting before it is delivered to avoid surprises ...

... and yes, the Meade RCX 20" really is **that** big.

300 kg

UNIVERSITY OF LIVERPOOL

34

Final Thoughts

- Your options are many and varied
- This is good ... and bad ... and confusing
- Don't suffer from "analysis paralysis"
 - Look at what you can afford
 - Take advice
 - Make a decision
 - Enjoy your stargazing
- Make full use of the resources of your astronomical society – the members
- The best telescope? The one you **use**.
