**NEW APPROACH**
SAVSNET can now survey prescription (Px) of all pharmaceutical agents, including those authorised for veterinary and human use.

**STUDY**
Data collected from 457 UK veterinary sites taking part in SAVSNET over two years.

**PRESCRIBING PATTERNS**
Vaccines were the most common Ps for cats, dogs and rabbits. Animals were frequently prescribed multiple agents in the same consultation.

**USE OF CASCADE**
Agents authorised for human use were prescribed to rabbits (8% of consultations), dogs (5%) and cats (3%).

**PX FOR RABBITS**
Rabbits were generally prescribed a less diverse range of agents than cats and dogs, likely due to a limited range of authorised or appropriate prescribing options.

**THANK YOU!**
Please take a look at the full paper for more results and discussion. Thank you to all participating veterinary practices for helping make this work possible.
