George Ellery Hale

George Hale (1868-1938) had a remarkable life.

His contributions to solar spectroscopy, such as his invention of the spectrohelioscope that imaged the Sun at different wavelengths, were surpassed by his vision and drive to design and construct the largest telescopes in the world.

6

Largest Telescopes in the World

7

Birth of the 200"

The 100" Hooker telescope was operational in 1918.

Hale now thought bigger... **More light!**

In 1928 he approached the Rockefeller Foundation and persuaded them to pledge \$6 million to build the 200" telescope and observatory.

Telescope Mounts

The diagram shows three types of telescope mounts: German, Fork, and English. Below the diagram are three photographs of actual telescopes: a 40-inch German mount, a 60-inch Fork mount, and a 100-inch English mount.

UNIVERSITY OF LIVERPOOL

13

100" Hooker

Hale did not want the 200" telescope to suffer from the same limitations as the 100" Hooker telescope. The English (yoke) mount meant that no observations could be made within 30° of the north celestial pole. More importantly, the plate glass mirror expanded and contracted with changing temperatures, distorting the mirror surface.

14

Horseshoe Yoke Mount

The photograph shows the 200-inch Hale telescope mounted on its white horseshoe yoke mount. Labels indicate the South and North directions.

UNIVERSITY OF LIVERPOOL

15

100" Mirror

Can the 100" mirror be scaled up to make a 200" mirror? Using plate glass would result in the same distortions with changing temperature, so Hale decided on the use of low-expansion glass. To avoid having a mirror 8 times heavier, it would need to be made with innovative glass-pouring techniques.

UNIVERSITY OF LIVERPOOL

16

Making a Mirror

An empty mould results in a slab of glass that is roughly flat on its top and bottom surfaces.

After cooling to room temperature the glass slab can be ground down to make a curved surface and then coated with a thin layer of aluminium.

17

Making a Ribbed Mirror

If the mould is first filled with 'cores' made of fire bricks then the glass flows around them.

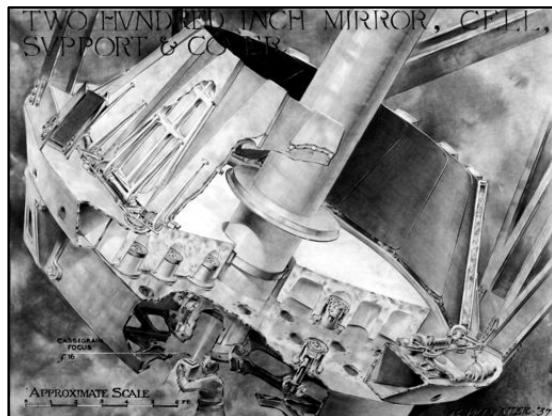

When the mirror has cooled the cores are removed.

The result is mirror with a front surface as before but now with a ribbed back, making it lighter and stronger.

23

Inspection

The first mirror blank was ruined by pieces of the mould floating to the surface, and by fire bricks falling from the inside wall of the annealing oven onto the mirror surface.

These problems were fixed for the casting of the second blank.

1935

THE EYE THAT SEEES
6,000,000,000,000,000,000 MILES

Tomorrow a new door in the screen of the universe will be opened. It is the door of a new telescope. Mr. Palomar, near San Diego, California, will be the first time the photographed, and the glass for the famous 200" telescope has been cast. The men at Corning are more experts now than they could have been.

UNIVERSITY OF LIVERPOOL

Corning Advert

Creating the 200" mirror blank from low-expansion Pyrex glass took years of innovation on the part of Corning.

After overcoming problems with the annealing ovens, dealing with a flood of the nearby river and even an earthquake, they were keen to promote the successful casting of the 200" mirror as their flagship project.

Russell Porter

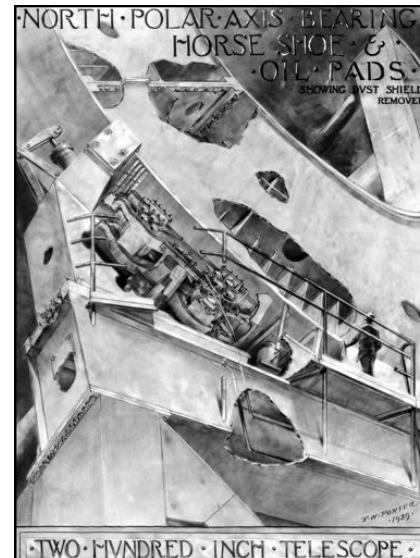

The highly detailed drawings made by Russell Porter between 1937 and 1940 (some of which are shown in the next eight slides) give a unique insight into the design and construction of the 200" telescope.

**RA Drive**

Right Ascension Drive and "Computer", an analogue computer comprising gears and cams that was designed to vary the drive speed automatically to account for very small variations in the apparent positions of the stars, such as those produced by refraction of starlight through the Earth's atmosphere.

Russell Porter 1940

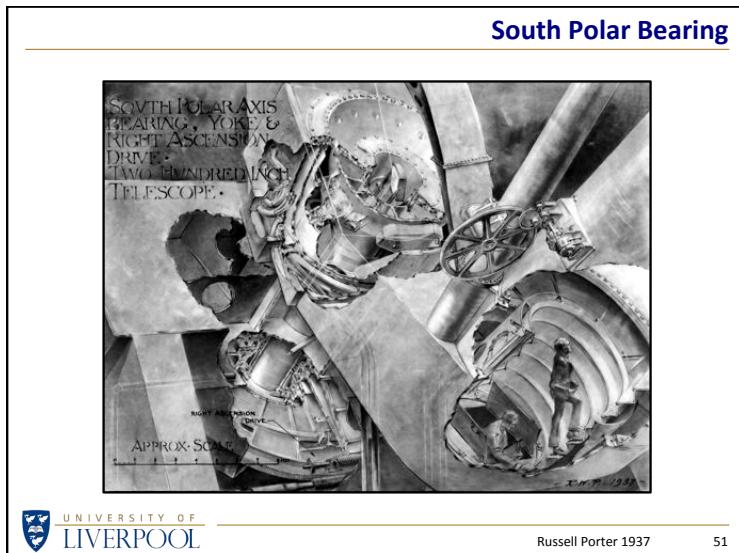

49

**Polar Axis Horseshoe**

The massive horseshoe bearing floats on four oil pads so that the friction is reduced to a thousand times less than would be the case for ball bearings or roller bearings.

Almost Complete?

Everybody thinks that the telescope is just months from being finished.

The telescope tube and mount are complete. The mirror has been ground to within a few millionths of an inch of the correct figure.

But ... it is 1941. The USA is about to be dragged into World War II.
