

The Beginning of Everything

The Beginning of Everything	
What am I talking about?	Creation of the Universe
When did it happen?	13.8 billion years ago
How long did it take?	About three minutes
Where did it happen?	Everywhere
Why did it evolve the way it did?	Laws of Physics
How do we know all this?	Laws of Physics

UNIVERSITY OF LIVERPOOL

2

Nature	
Nature is not repetitive	(If it was, it would be boring)
Nature is not unpredictable	(If it was, it would be impossible to make sense of the world)
Hence, Nature is interesting	
How does Nature work? What are the Rules of the Game?	

UNIVERSITY OF LIVERPOOL

The Beginning of Everything

Rules of the Game

Snapshot of the Universe

The Beginning of Everything

Complex ≠ Incomprehensible

" The most incomprehensible thing about the world is that it is comprehensible "

Flow of Thought

- Observation** Galaxies are moving away from each other
- Conclusion** The Universe is expanding
- Observation** Particle physics experiments (such as the LHC)
- Assumption** Laws of physics (here) = laws of physics (there)
Laws of physics (now) = laws of physics (then)
- Conclusion** The Universe was created in a very hot dense state 13.8 billion years ago and has been expanding and cooling ever since
- Big Question** Where did all the matter we see today come from?

The Beginning of Everything

How Far Back?

How far back can we go (before we give up on the laws of physics)?

The first billion years of the 13.8 billion year history?

The first million years? The first thousand years? The first year?

The first day? The first hour? The first minute? The first second?

The first ms? The first μ s? The first ns? The first ps?

Before the first picosecond, we are on slightly shakey ground.

Everything after that is relatively well understood.

Contents

- Introduction
- A few basic ideas
- The first fraction of a second
- The first few seconds
- The first few minutes
- The next 377,000 years
- The next 13.8 billion years (in brief)

A Few Basic Ideas

We are made of atoms

atom = nucleus + electrons

nucleus = protons + neutrons

proton = 3 quarks

Lower Energy COLD
Higher Energy HOT
Time

t = 0

What happened at the instant of $t = 0$?

Science cannot provide a definitive answer.

Maybe it was a 'quantum fluctuation' in which energy, and hence matter ($E = mc^2$), is borrowed from nothing. This sounds weird, but quantum mechanics is weird.*

How big can the fluctuation be? Energy x time has an upper limit.

You can borrow a lot of energy for a short time, or *vice versa*.

The total energy in the universe might be zero and so the time period we are given to 'pay back the loan' might be infinite.

The Beginning of Everything

[illegible]

At the unimaginably early time of 10^{-35} seconds after its creation, the Universe has expanded to the size of a golf ball.

Just like a golf ball, the Universe is not perfectly smooth, but has 'dimples' in it.

Eventually, when the Universe is much, much bigger, these dimples will give rise to variations in the density of matter spread across the Universe. These will result in the formation of large-scale structures such as clusters of galaxies.

17

$t > 0$

The First Picosecond

$$t \approx 0.0000000000001 \text{ s}$$

One picosecond (10^{-12} seconds) after its creation, the Universe has expanded to the size of the Solar System — which, of course, does not yet exist.

The temperature has fallen to $T \approx 10^{15}$ K and the energy of each of the constituents of the **quark soup** is \approx the energy of the LHC.

Because we can test our ideas in an accelerator, from this point on we have a reasonably good idea of how the Universe evolved.

18

Matter and Antimatter

$$t \approx 0.0000000000001 \text{ s}$$

Energy and matter were continually exchanging back and forth.

Matter and antimatter were originally made in equal amounts.

Somehow, matter gained a very small excess over antimatter.

19

Matter and Antimatter

$$t \approx 0.0000000000001 \text{ s}$$

20

The Beginning of Everything

The First Millisecond

$t \approx 0.001 \text{ s}$

Matter and antimatter continue to pop in to and out of existence.

Protons and neutrons, both made from three constituent quarks, are continually transforming into each other.

Proton
2 u + 1 d
quarks

Neutron
1 u + 2 d
quarks

UNIVERSITY OF LIVERPOOL

21

The First Few Seconds

$t \approx 1 \text{ s}$

The Universe has cooled to $T \approx 1$ billion K.

It is now too cold for protons and neutrons to readily swap back and forth. Protons are a little lighter than neutrons (by $\sim 0.1\%$) ...

... and so protons outnumber neutrons in the ratio 75 : 25.

(Nature always favours the lower energy)
(or the lower mass)

UNIVERSITY OF LIVERPOOL

22

The First Few Minutes

$t \approx 100 \text{ s}$

Neutrons are unstable and some decay into protons.

The ratio of protons : neutrons is now $\approx 14 : 2$

The Universe has cooled to $T \approx 100$ million K. Nuclei can now form.

12 nuclei of H

+

1 nucleus of He

After 3 minutes, the relative abundance of H and He is determined.

UNIVERSITY OF LIVERPOOL

23

The Next 377,000 Years

Nothing (much) happens for the next third of a million years. The Universe continues to expand and cool.

Eventually the Universe cools to $T \approx 3000 \text{ K}$.

At this temperature nuclei can hang on to electrons and so atoms can exist for the first time. The Universe changes from an ionised **plasma** to a collection of **atoms**. It becomes **transparent** to light.

Light that was, until this point, 'trapped' inside the plasma is now free to fly around the Universe. We see this light today, but much stretched out by the subsequent expansion of the Universe.

The wavelength of the light is now 1000 x longer — **microwaves**.

UNIVERSITY OF LIVERPOOL

24

The Beginning of Everything

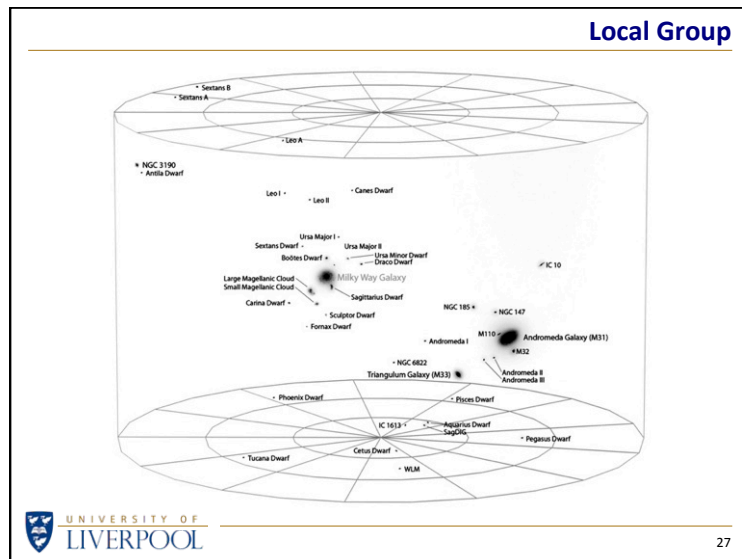

Cosmic Microwave Background

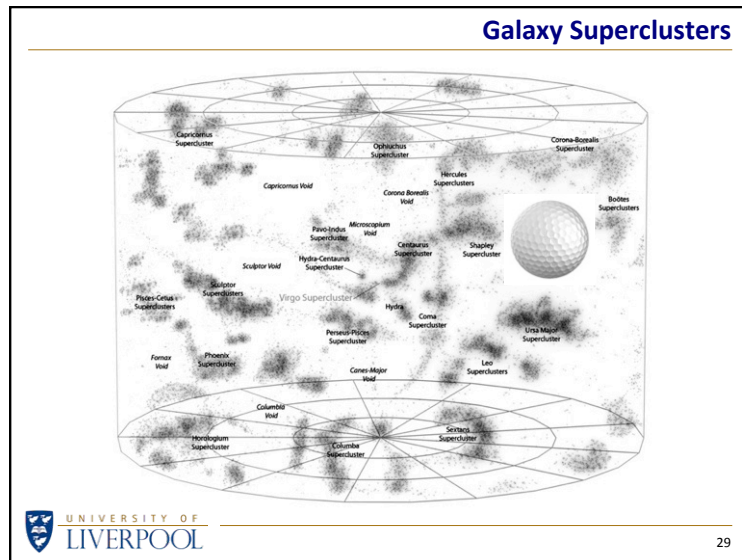

The cosmic microwave background (CMB) that we observe today is approximately the same intensity in all directions, but is not perfectly smooth.

The **small variations** in intensity seen in the all-sky map are the result of the 'dimples' in the cosmic golf ball.

Satellites are being used to study the CMB to greater precision to improve our understanding of the very early Universe.

The Beginning of Everything

The Beginning of Everything

The Next 13.8 Billion Years

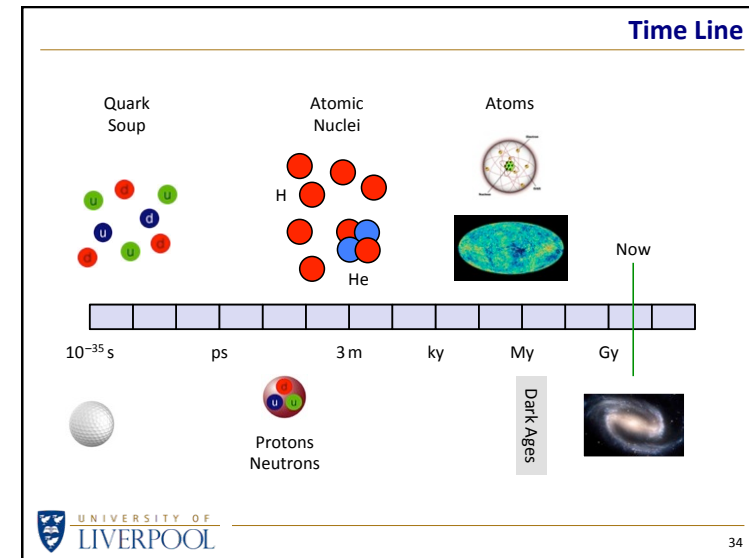

Now that we have hydrogen atoms we can understand...

There are still some details of cosmic evolution to be worked out, but you get the basic idea.

 UNIVERSITY OF LIVERPOOL

Questions

The jigsaw is still not complete. (We have found the corners, the edges and most of the landscape, but there are still pieces of sky missing.) The remaining questions are:

Why did **Matter** win over **Antimatter**? (what caused the asymmetry?)

What is **Dark Matter**? (causing galaxies to rotate at the 'wrong' speed)

What is **Dark Energy**? (causing the Universe to *accelerate* its expansion)

This talk is titled 'The Beginning of **Everything**' but all the ordinary matter in the Universe accounts for only 4% of the total.

The other 96% is still a bit of a mystery. But that's another story...
