Mons Telescope

Mons Telescope

20" ex-research
telescope

Moved from its
original home at
Mons University,
it is now used for
teaching

In the Warm Room

What Do the Students Observe?

The students are expected to calculate the coordinates of the objects that they want to observe and then point the Mons telescope, using setting circles, to an accuracy of a few arc-min.

Working in teams of 3 or 4, the students decide on what type of objects they want to study during the week. Examples are:

Star Clusters: Measuring star intensities with different colour filters to generate Hertzsprung-Russell diagrams

Planetary Nebulae: Revealing the nebulae structure visible with hydrogen ($H\alpha$) or oxygen (O-III) filters

Galaxies: Identifying star formation regions in spiral galaxies using a hydrogen ($H\alpha$) filter

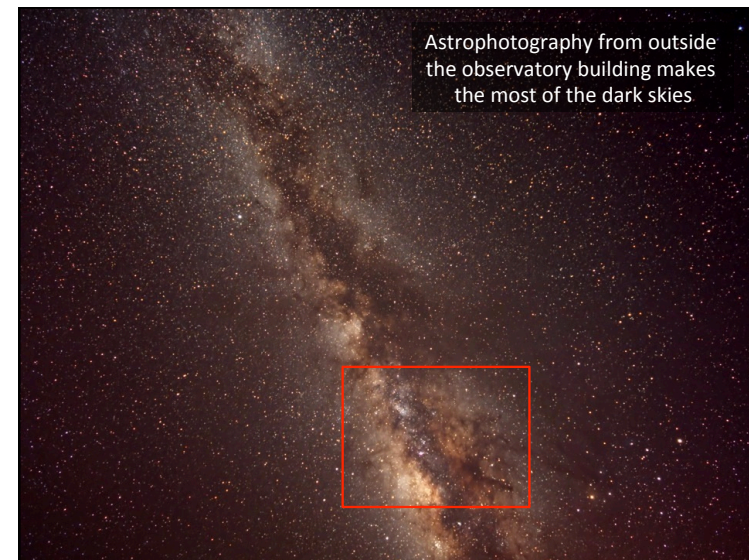

Astrophotography

Milky Way in Sagittarius and Scorpius

A mosaic of four images, each a 4-minute exposure
Taken with a Nikon D7100 DSLR + 85mm f/1.8 lens
Processed from JPEGs with no darks and no flats

A Week Above the Clouds

Liverpool Telescope

The Liverpool Telescope is on the neighbouring island of La Palma

A research class telescope with a 2 m mirror that can be used for 20% of the time by students and schools around the world
